Atomic, molecular, and optical physics is the study of matter-matter and light-matter interactions; at the scale of one or a few atoms and energy scales around several electron volts. The three areas are closely interrelated. AMO theory includes classical, semi-classical and quantum treatments. Typically, the theory and applications of emission, absorption, scattering of electromagnetic radiation from excited atoms and molecules, analysis of spectroscopy, generation of lasers and masers, and the

This book introduces the fundamental quantum physics of atoms and molecules. Divided into three parts, the first provides a historical perspective leading to the contemporary view of atomic and molecular physics, outlining the principles of non-relativistic quantum mechanics. The second part covers the physical description of atoms and their interaction with radiation, whilst the third part deals with molecular physics.

The Atomic, Molecular and Optical (AMO) Physics group has theoretical and experimental components. The theoretical group studies the dynamics of electrons in isolated atoms and molecules elicited by light pulses and electron projectiles. The group is focused on the development of new theoretical techniques to compute the distribution of fragments emerging from photoionization and photodetachment events, electron-atom and electron molecule collisions, possibly assisted by light, as well as ...
