Building a comprehensive R & M Program Plan covering all phases of the product life cycle is the only way to ensure product / system reliability. R & M program is far more than a simple calculation of an MTBF - it is an outline defining each task / element functional requirements and constraints for each stage of the product life cycle: concept, design, manufacturing, operation and maintenance.

Reliability growth models allow estimation of resources (particularly testing time) necessary before a system will mature to meet those goals (Meeker and Escobar 1998). Maintainability models describe the time necessary to return a failed repairable system to service. They are usually the sum of a set of models describing different aspects of the maintenance process (e.g., diagnosis, repair, inspection, reporting, and evacuation).
